

Power generation from photovoltaic solar systems

Overview

Solar photovoltaic (PV) power generation is the process of converting energy from the sun into electricity using solar panels. Solar panels, also called PV panels, are combined into arrays in a PV system. PV systems can also be installed in grid-connected or off-grid (stand-alone) configurations. It consists of an arrangement of several components, including solar panels to absorb and convert sunlight into electricity, a solar inverter, and a battery storage system. Photovoltaics (PV) is the conversion of light into electricity using semiconducting materials that exhibit the photovoltaic effect, a phenomenon studied in physics, photochemistry, and electrochemistry. These photons contain varying amounts of energy. Recent policy changes are expected to affect the pace at which solar PV capacity is added annually through the end of this decade. An individual PV cell is usually small, typically producing about 1 or 2 watts of power. These cells are made of different materials.
