

Three forms of solar thermal power generation

Overview

According to the different ways of concentrating solar energy, solar thermal power generation systems can be divided into three types, namely trough solar thermal power generation systems, tower solar thermal power generation systems and dish solar thermal power generation systems. Solar thermal collectors are classified by the United States Energy Information Administration as low-, medium-. All solar thermal power systems have solar energy collectors with two main components: reflectors (mirrors) that capture and focus sunlight onto a receiver. In most types of systems, a heat-transfer fluid is heated and circulated in the receiver and used to produce steam. The steam is converted. Solar thermal energy consists of the transformation of solar energy into thermal energy. It is a form of renewable, sustainable, and environmentally friendly energy.
